Fast Automatic Stabilizer

The **Fast Automatic Stabilizer** is developed by Damen Hydrauliek and is unique in its kind. It's written in the EN12999 that stabilizer cylinders, from 1-1-2010, must be provided with a ball head. Because of this it is possible for the support plate to make movements to an angle of minimum 10°. This version of the **FAS K** meets the legal requirements of **EN12999** and is **CE** approved by **TÜV**.

Functioning of the FAS-K

The **FAS K** has been developed to help the operator spare its back and gain time with supporting its vehicle. The operator does not have to at, on a stable hard underground, extra plastic support plates under the support leg dish. These support plates are most of the time heavy and the operator must lift these of the ground. The **FAS K** is provided with a large support plate which reduces the ground pressure per mm² and remains within the European standard.

The **FAS K** does not need more space in tipped up situation than a standard support leg. The support plates remain in tipped up situation within the legal maximum breadth of the vehicle. (2,55m) The **FAS K** can also be used when the support leg beams are not slid out.
